

AstraCore Competitive Intelligence Report

Date: 2026-05-25

Prepared for: Roberto Avila (R.A.)

Purpose: Summarize competitive research and define a practical P5-1 execution wedge.

1) Executive Summary

The AI meeting assistant market is crowded in recording, transcription, and summarization. AstraCore has strongest opportunity in causal timeline intelligence + action follow-through verification.

Recommended strategic wedge: Causal Deal/Project Navigator.

P5-1 should remain read-only and deterministic to preserve backend reliability momentum.

2) Competitor Set (20 products researched)

Fireflies.ai, Otter.ai, Fathom, Gong, ZoomInfo Chorus, Grain, tl;dv, Read AI, Sembly AI, Avoma, Supernormal, Krisp AI, Notion AI, Fellow, MeetGeek, Jamie, Granola, Bubbles, Salesloft (Conversation Intelligence), Jiminny.

These competitors cover SMB to enterprise across meeting notes, conversation intelligence, and workflow integrations.

3) Market Findings

Crowded capabilities:

- Recording and transcription
- AI summaries and action-item extraction
- Basic CRM/task integrations
- Meeting-level analytics

Underserved capabilities:

- True causal analysis across decisions -> tasks -> outcomes
- Persistent role-aware memory with provenance
- Cross-surface multimodal graph (screen + voice + docs + tickets)
- Compliance-grade private deployment options
- Closed-loop automation with verification and rollback

4) Capability Matrix Conclusion

Enterprise tools (e.g., Gong/Chorus class) are strong in sales coaching and reporting but still weak in general causal graphing and execution verification.

SMB tools (e.g., Otter/Fireflies/Fathom class) are strong in capture convenience but weak in durable intelligence and deterministic action reliability.

Platform bundles (Microsoft/Google ecosystems) are broad but not opinionated around causal operator workflows.

5) Strategic Whitespace (Top 5)

1. Causal timeline intelligence across meetings and downstream actions.
2. Persistent organization memory with role permissions and provenance.

3. Multimodal work graph beyond meetings.
4. Privacy-first deployment path for regulated buyers.
5. Deterministic action layer with approval + verification loops.

6) Recommended AstraCore Wedge

Primary wedge: Causal Deal/Project Navigator.

Why now:

- Fits the current consult timeline architecture already shipped in P3/P4.
- Produces measurable operator outcomes (fewer dropped commitments, better follow-through visibility).
- Can ship incrementally without overbuilding infrastructure.

7) P5-1 Build Spec (Proposed)

Name: P5-1 ? Causal Follow-through Signals (read-only)

Endpoint extension: GET /api/session/{session_id}/consult with include_follow_through=true|false

Per-match output when enabled:

- follow_through.signals[]:
 - signal_type (task_created | task_completed | status_change | owner_ack)
 - epoch_ms
 - source
 - confidence (0..1)
 - evidence_snippet
- follow_through.score (0..100)

Determinism rules:

- Stable sort by epoch_ms asc inside follow-through signals
- Explicit weighted constants for score calculation
- No mutation of source artifacts

8) Validation & Done Definition

Required tests:

- Positive path: signals extracted correctly
- No-signal path: empty signals + stable score behavior
- Ordering path: deterministic signal order

Validation commands:

- pytest -q
- python -m compileall app

Done when:

- Existing consult behavior unchanged when include_follow_through is omitted
- New response block appears only when requested
- Tests/compile pass and README is updated

9) Recommended Sequence After P5-1

P5-2: Aggregate follow-through stats in top-level response.

P5-3: Add min_follow_through_score filter.

P5-4: Add debug counters for follow-through gating.

10) Operator Note

This report is strategy guidance based on public product positioning and capability patterns.

Final product decisions should prioritize execution speed, deterministic behavior, and measurable operator value.
